

## Streams & Culverts

The Lake Funding Task Force Committee toured the lake in May to identify runoff streams and culverts that empty into the Lake. These can be a source of nutrient loading into the lake in the form of nutrient-rich sediment and water runoff in the spring and after a heavy rain. Our goal is to minimize the amount of nutrients flowing into the lake, creating a fertile environment for weed growth. In order to accomplish this we intend to apply for and receive grant money from NYS DEC, as well as any type of assistance we can get from our local town and county highway departments. The points that we located are noted on the map. If there are sources we have missed or you have knowledge of the status of a runoff source please note it on the map and send it in to the CLIA, PO Box 81, Cossayuna, NY 12823
